The application has been amended as follows: cancel claim 25 and include its subject matter into claim 24.

24. (amended) A driver circuit comprising a semiconductor integrated circuit having a transistor in which a drive signal is applied to the transistor to drive the transistor to thereby drive a load, the driver circuit comprising:

an element region at least partially surrounded by an element isolation region;

a signal line that supplies the drive signal to the transistor, the signal line extending across the element region;

a first dielectric layer comprising a gate dielectric layer formed in the element region;

a gate electrode layer, wherein part of the gate electrode layer is positioned on the gate dielectric layer in the element region and part of the gate electrode layer is positioned outside of the element region; and

at least two connection sections that connect the signal line to a gate electrode layer, wherein at least one connection section is positioned outside of the element region and at least one connection section is positioned in the element region;

the transistor including a source region and a drain region in the element region; and a second dielectric layer, wherein the signal line includes a signal line portion that is separated from the source region by the second dielectric layer,

and wherein the source region and the signal line portion are positioned so that a line extending perpendicular from an upper surface of part of the source region will contact the signal line portion.
